

Syllabus of Measure and Integration

- Lecture time: Tuesday, Friday 16:00–18:00
- Lecture room: Block S14, Room 06–19
- Tutorial time: Monday 12:00–13:00
- Tutorial room: Block S17, Room 04–04
- Prerequisite: MA3209
- Course description: This module is suitable not only for mathematics majors, but also for science and engineering majors who need a rigorous introduction to the concepts of measures and integrals. It covers Lebesgue measure and Lebesgue integral in a rigorous manner. We begin complicated proofs with an introduction which shows why the proof works. Examples are included to show why each hypothesis of a major theorem is necessary. Major topics: Lebesgue measure. Outer measure. Measurable sets. Regularity of Lebesgue measure. Existence of non-measurable sets. Measurable functions. Egoroffs Theorem. Lusin's Theorem. Lebesgue integral. Convergence theorem. Differentiation. Vitali covering lemma. Functions of bounded variation. Absolute continuity. L^p spaces. Holder's inequality. Minkowski's inequality. Riesz–Fischer theorem.

- Assessment: Assessment of students will be based on
 - a one-hour test during lecture time (*tentatively* on 6 October 2016), 25%
 - tutorial participation, 5%,
 - a two-and-a-half hour final examination, 70%.

Any student who is absent without a valid reason from an assessment will be given zero mark for that assessment.
